

HPLC Method for Analysis of Metformin on Primesep 100 Column

<https://sielc.com/hplc-method-for-analysis-metformin>

Chromatogram

Column:	Primesep 100
Column size:	4.6 × 150 mm, 5 µm
Column part number:	100-46.150.0510
Mobile phase:	MeCN/H ₂ O – 75/25%
Buffer:	AmFm pH 3.0 - 20 mM
Flow rate:	1.0 mL/min
Detection:	UV 240 nm
Injection volume:	2.0 µL
Sample:	1.0 mg/ml
LOD:	8 ppb

Description

· HPLC Method for Analysis of Metformin on Primesep 100 Column by SIELC Technologies

Biguanides, including Moroxydine, Metformin, Proguanil, and Phenformin, are a group of organic compounds that share a common structural feature, namely the presence of two guanidine groups.

Metformin is an oral antidiabetic medication with the chemical formula C₄H₁₁N₅. It is primarily used to treat type 2 diabetes. It works by reducing glucose production in the liver and improving insulin sensitivity in peripheral tissues. Metformin is one of the most widely prescribed drugs for diabetes management. You can find detailed UV spectra of Metformin and information about its various lambda maxima by visiting the following link.

These biguanides exhibit various pharmacological activities, and while some are primarily used for antidiabetic purposes, others have applications in antiviral or antimalarial treatments. It's important to note that the safety and efficacy of these drugs depend on proper medical supervision and adherence to prescribed dosages.

Metformin can be retained and analyzed using a Primesep 100 mixed-mode stationary phase column. The analysis employs an isocratic method with a simple mobile phase comprising water, acetonitrile (MeCN), and ammonium formate as a buffer. This method allows for detection using UV at 240 nm

Method Parameters

Mobile Phase	MeCN/H ₂ O 75/25%
Buffer	AmFm pH 3.0 – 30 mM
Flow Rate	1.0 ml/min
Detection	UV 240 nm
Samples	0.5 mg/ml
Injection volume	2 µl
LOD*	8 ppb
Class of Compounds	Biguanides
Analyzing Compounds	Metformin

HPLC Column Used

Primesep 100, 4.6 x 150 mm, 5 µm, 100 A, dual ended
